

FIXED POINTS AND NOETHERIAN TOPOLOGIES

Aliaume Lopez

Ph.D Student of Sylvain Schmitz and Jean Goubault-Larrecq

Wednesday, April 26, 2023

FoSSaCS 2023, Paris, France

♣ Old things

- what a well-quasi-order is.
- what Noetherian rings and Noetherian spaces are.
- how to inductively define well-quasi-orders.

♣ Old things

- what a well-quasi-order is.
- what Noetherian rings and Noetherian spaces are.
- how to inductively define well-quasi-orders.

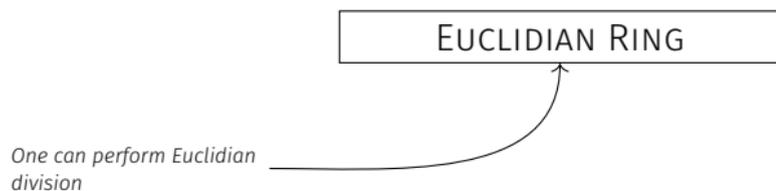

♦ New things

- how to inductively define Noetherian topologies.
- “simpler” proofs of previous constructions.
- justification that previous definitions were “good”.

THANK YOU!

WAIT ...

WHAT IS A NOETHERIAN SPACE??

$$(\mathbb{R}[X_1, \dots, X_n], +, \times)$$

$$(\mathbb{C}[X, Y], +, \times)$$

$$(\mathbb{Q}[\sqrt{-19}], +, \times)$$

EUCLIDIAN RING

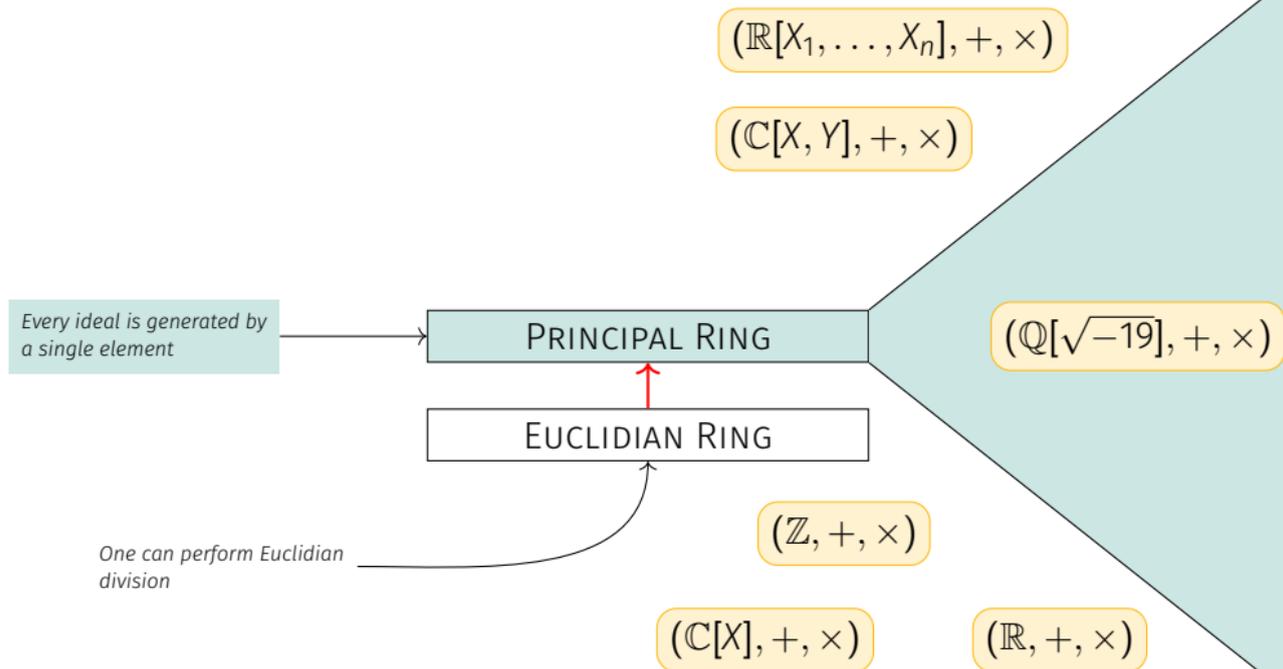

One can perform Euclidian
division

$$(\mathbb{Z}, +, \times)$$

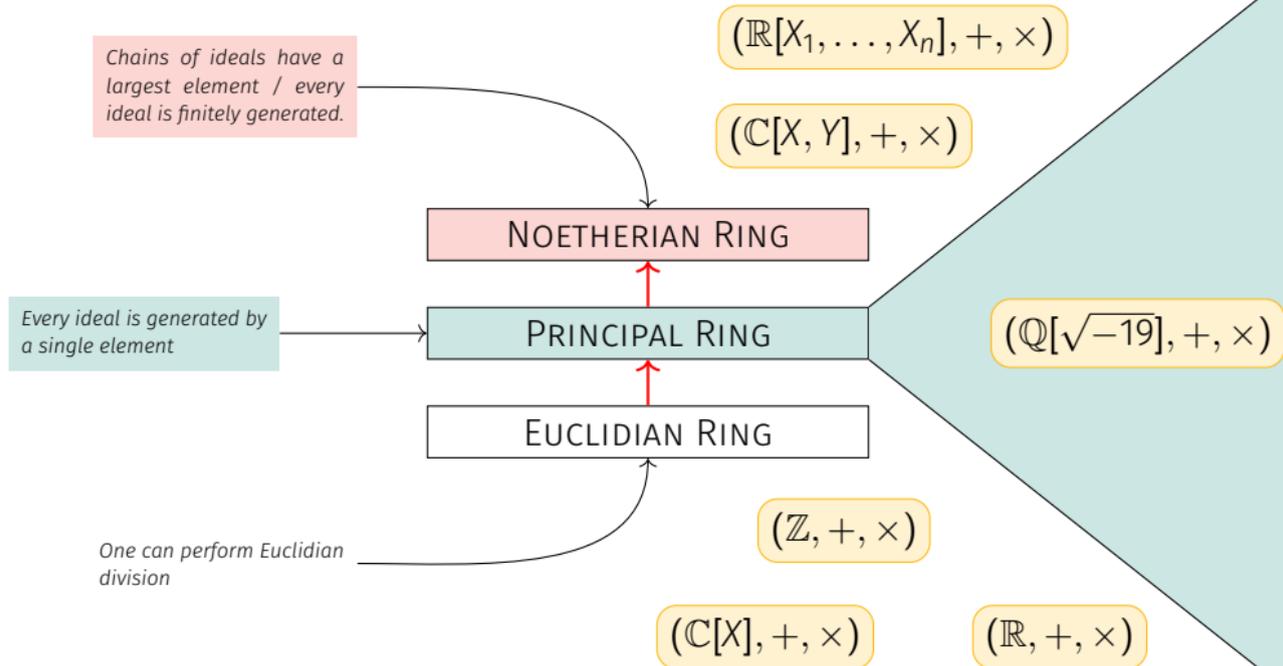

$$(\mathbb{C}[X], +, \times)$$

$$(\mathbb{R}, +, \times)$$

“An ideal is a subset closed under sums, and absorbant for products.”

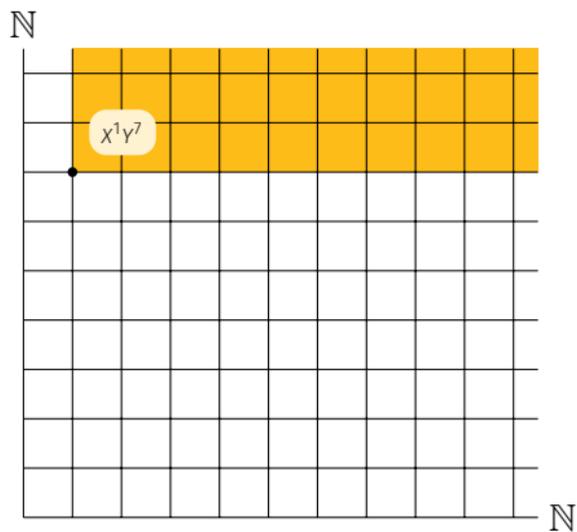

“An ideal is a subset closed under sums, and absorbant for products.”

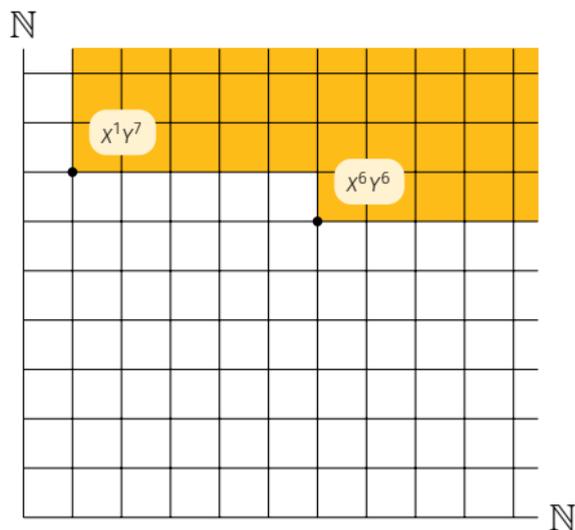

“A Noetherian Space is the spectrum of a Noetherian Ring.”

Looking at ideals generated by $X^n Y^m$.

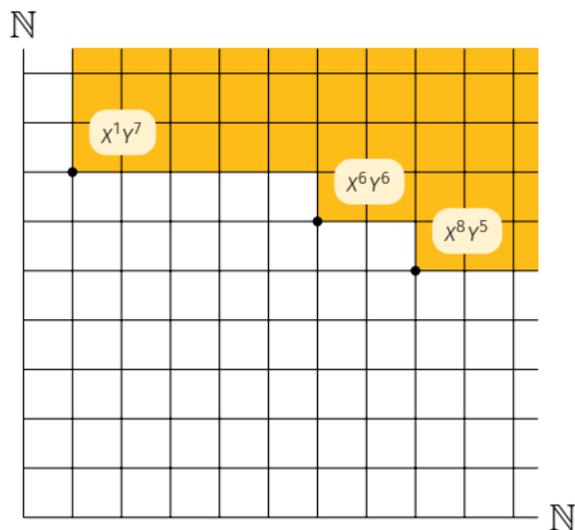

Looking at ideals generated by $X^n Y^m$.

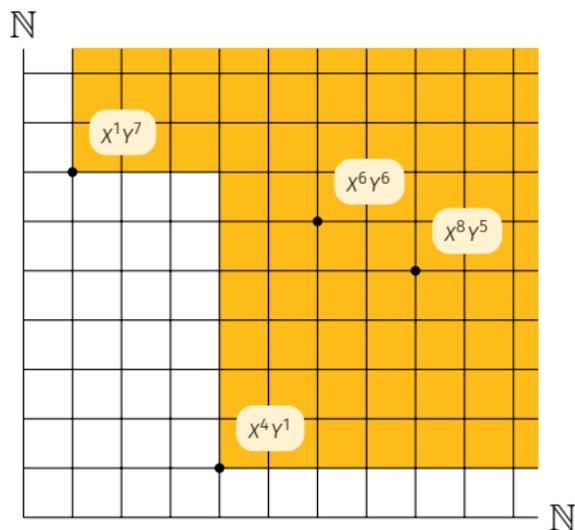

Sounds like $(\mathbb{N} \times \mathbb{N}, \leq \times \leq)$ has a nice property...

Looking at ideals generated by $X^n Y^m$.

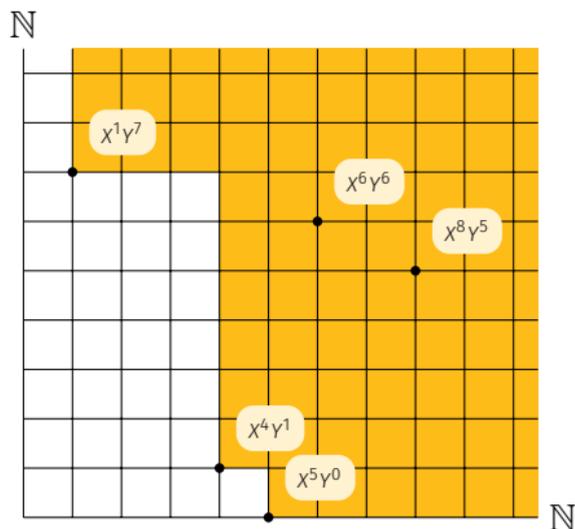

Sounds like $(\mathbb{N} \times \mathbb{N}, \leq \times \leq)$ has a nice property... (it is a well-quasi-order)

1. Why these topologies/orderings?
2. Why not a generic theorem?

A FIXED POINT THEOREM ... “AS PROMISED”

A SIMPLE FIXPOINT APPROACH

With E monotone and fixing [Noetherian topologies](#).

Theorem

If E is monotone, fixes Noetherian topologies, and respects subsets, then the least fixed point of E is a Noetherian topology.

Theorem

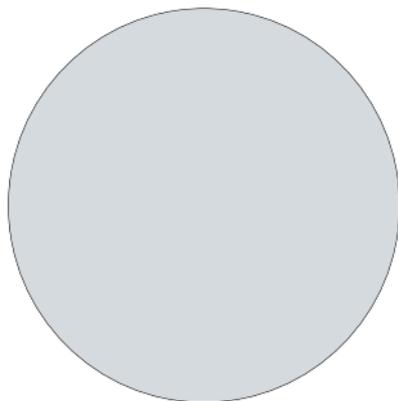

If E is monotone, fixes Noetherian topologies, and respects subsets, then the least fixed point of E is a Noetherian topology.

♣ Remarks

- The extra condition is needed
- The proof uses a topological minimal bad sequence argument

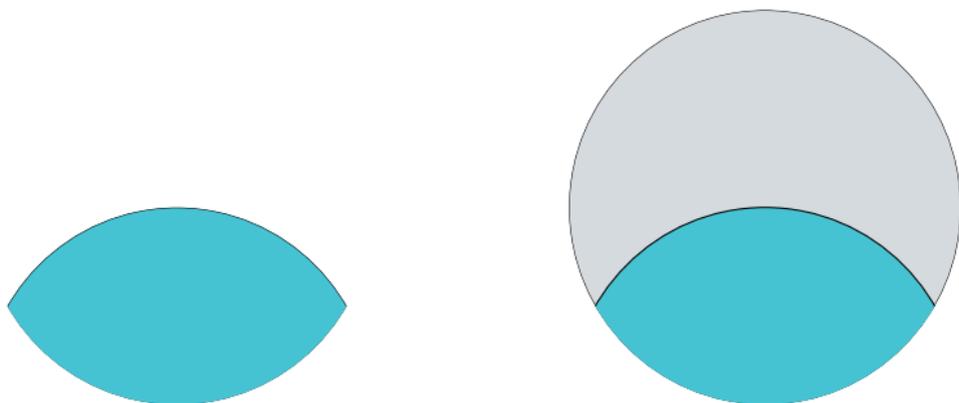

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

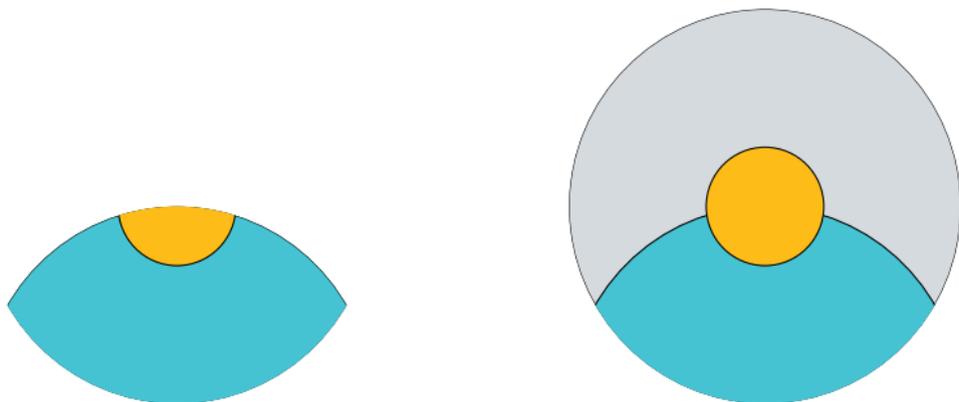

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

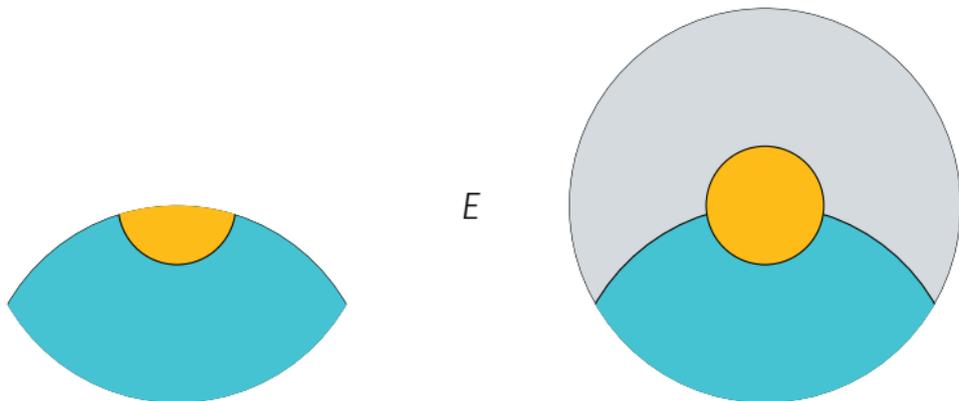

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

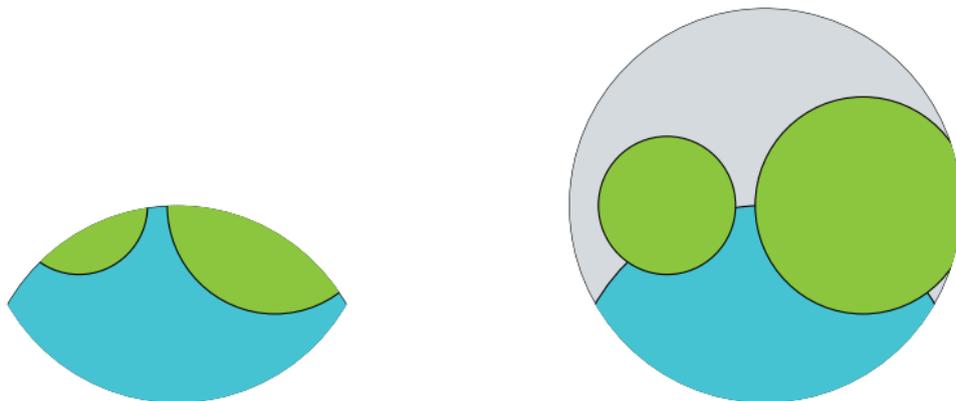

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

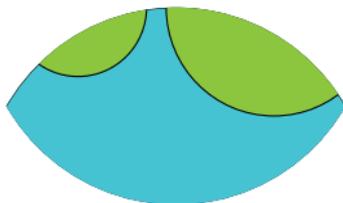

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

For all τ , H closed subset of τ ,

$$E(\tau | H) | H = E(\tau) | H$$

CONTRIBUTIONS

HOW DOES IT ANSWER ANYTHING?

Theorem

Given an inductively defined space $\mathcal{X} = F(\mathcal{X})$, one can derive a generic topology expander.

Theorem

Given an inductively defined space $\mathcal{X} = F(\mathcal{X})$, one can derive a generic topology expander.

♣ Remarks

- Gives back the previous topologies for finite words and finite trees!
- Correctly generalizes with what is done in the realm of well-quasi-orders, e.g., by Hasegawa (2002).

♣ Non inductive cases...

- Infinite words,
- Ordinal words,
- Ordinal branching trees.

CONCLUSION

WHAT'S TO REMEMBER NOW?

◆ Takeaway

- You can build reasonable inductive topologies
- You can forget analytic functors
